Description

The PI6C557-01BQ is a spread spectrum clock generator compliant to PCI Express[®] 3.0 and Ethernet requirements. The device is used for Automotive systems.

The PI6C557-01BQ provides one differential (HCSL) or LVDS spread spectrum output. Using Pericom's patented Phase-Locked Loop (PLL) techniques, the device takes a 25MHz crystal input and produces one pair of differential outputs (HCSL) at 100MHz. It also provides spread selection of -0.5% and no spread.

Application Information

Decoupling Capacitors

Decoupling capacitors of 0.01μ F should be connected between each V_{DD} pin and the ground plane and placed as close to the V_{DD} pin as possible.

Crystal

Use a 25MHz fundamental mode parallel resonant crystal with less than 300PPM of error across temperature.

Crystal Capacitors

 C_L = Crystals's load capacitance in pF

Crystal Capacitors (pF) = $(C_L - 8) * 2$

For example, for a crystal with 16pF load caps, the external effective crystal cap would be 16 pF. (16-8)*2=16.

Current Source (IREF) Reference Resistor - R_R

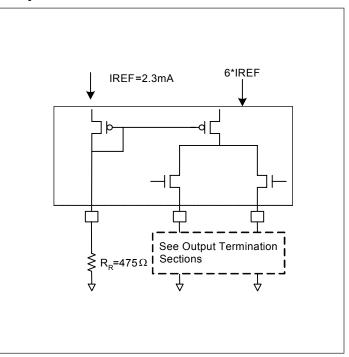

If board target trace impedance is 50Ω , then $R_R = 475\Omega$ providing an IREF of 2.32 mA. The output current (I_{OH}) is 6*IREF.

Output Termination

The PCI Express differential clock outputs of the PI6C557-01BQ are open source drivers and require an external series resistor and a resistor to ground. These resistor values and their allowable locations are shown in detail in the PCI Express Layout Guidelines section.

The PI6C557-01BQ can be configured for LVDS compatible voltage levels. See the LVDS Compatible Layout Guidelines section.

Recomended Crystal Specification

Pericom recommends:

a) FL2500184Q, SMD 3.2x2.5(4P), 25M, CL=20pF, Frequency Tolerance ±15ppm, Stability ±20ppm (http://www.pericom.com/pdf/datasheets/se/FL.pdfb)

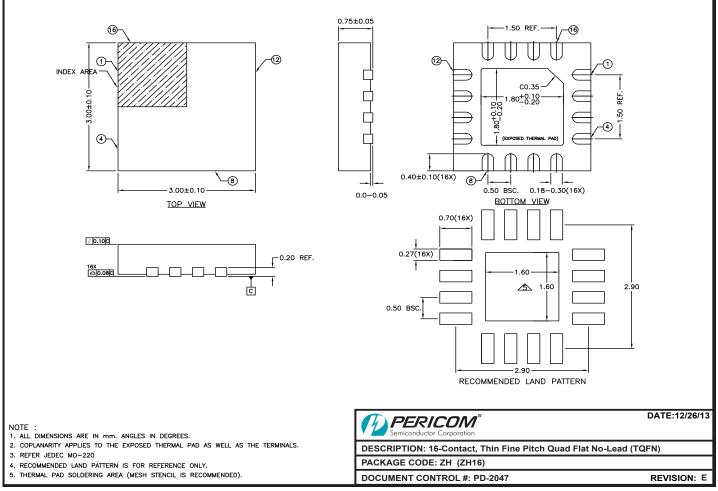

Recommended Crystal Circuit

The following diagram shows PI6C557-05Q crystal circuit connection with a parallel crystal. For the C L=20pF parallel crystal, it is suggested to use C1=27 pF, C2=27 pF in general. C1 and C2 can be adjusted to fine tune to the target ppm of crystal oscillation according to different board layouts. R1=360 ohm is recommended in layout for smaller size crystal drive level adjustment.
